Real-time analytics with SAS

Dashboards have long been used by businesses to track the various performance indicators or gain insights from large volume of data collected over time.

Non-profit organizations have been slower to adopt dashboards, however several NGOs have demonstrated interest in building application-specific dashboards as more data is made public. These allow them to track events taking place outside the organization or consolidate multiple sources of data and quickly take appropriate action in a situation of emergency.

This presentation will illustrate how SAS and analytics support the efforts of NPO like the International Organization for Migration and the United Nations.

Target session:

- Business and Industry
- Research and Education
- Official Statistics
